

CBD + THC

THC Products

- Produces a "High"
- Alters mood and perception
- Can impair memory and coordination
- Can increase appetite

CBD Products

- Usually does not produce a "high"
- Used for relaxation
- Does not typically increase appetite

Research shows the brain continues developing until about age 25, making teens more vulnerable to THC effects.

Use can cause increased heart rate, anxiety, memory, impairment and addiction risk.

While CBD is federally legal, it is still regulated differently from state to state. TCH is NOT legal in all states, but some allowed medical or recreational use.

Check the laws for your specific state and be cautious crossing state lines.

CBD can cause...

- Drowsiness
- Dry Mouth
- Fatigue
- Possible medication Interactions

THC can cause...

- Anxiety or Paranoia
- Red Eyes
- Slower reaction time
- Memory Problems
- Dizziness

DELTA THC

"DELTA THCS ARE DIFFERENT FORMS OF THC, OR THE PSYCHOACTIVE CHEMICAL FOUND IN CANNABIS. THE "DELTA" NUMBER REFERS TO THE POSITION OF A DOUBLE BOND IN THE MOLECULE'S STRUCTURE. EVEN SMALL CHEMICAL DIFFERENCES CAN CHANGE THE STRENGTH AND EFFECTS."
-UNIVERSITY OF SOUTH CAROLINA

THC USE IN YOUNG ADULTS AND CHILDREN MAY AFFECT:
BRAIN DEVELOPMENT
MEMORY
ATTENTION SPAN
MENTAL HEALTH

MORE THC USE IN YOUNG ADULTS HAS BEEN LINKED TO INCREASED RISK OF DEPRESSION, ANXIETY, AND SUBSTANCE USE DISORDERS.

LAWS AND REGULATIONS FOR DELTA 8, 9, AND 10 VARY FROM STATE TO STATE, AND DELTA 9 REMAINS FEDERALLY ILLEGAL. CHECK LOCAL LAWS FOR MORE INFORMATION IN YOUR STATE.

DELTA-9 THC	DELTA-8 THC	DELTA-10 THC
High 	Medium 	Mild 
Strong euphoric high, relaxing, alters senses	Relaxed, calm, mild euphoria	Uplifting, energizing, more alert
 Cannabis (marijuana)	 Hemp-derived (from CBD)	 Hemp-derived (from CBD)
Recreation, euphoria, pain relief, increased appetite	Stress relief, relaxation, sleep support, mild recreational use	Daytime use, focus, creativity, mood support
Anxiety, paranoia, dry mouth, red eyes, increased heart rate	Drowsiness, dry mouth, slower reaction time, confusion	Anxiety at high doses, fast heart rate, dry mouth

Caffeine

Effects:

Increased alertness

More energy

Better focus

Jitters

Fast heartbeat

Anxiety

Trouble sleeping

Headaches

- About 85–90% of adults in the United States consume caffeine daily.
- The average U.S. adult consumes around 200 mg of caffeine per day.
- Coffee is the #1 source of caffeine for adults.

Energy drink use has increased significantly among adults ages 18–34.

Emergency room visits involving energy drinks and caffeine doubled from about 10,000 visits in 2007 to over 20,000 visits in 2011 – NCBI

High caffeine intake has been linked to:

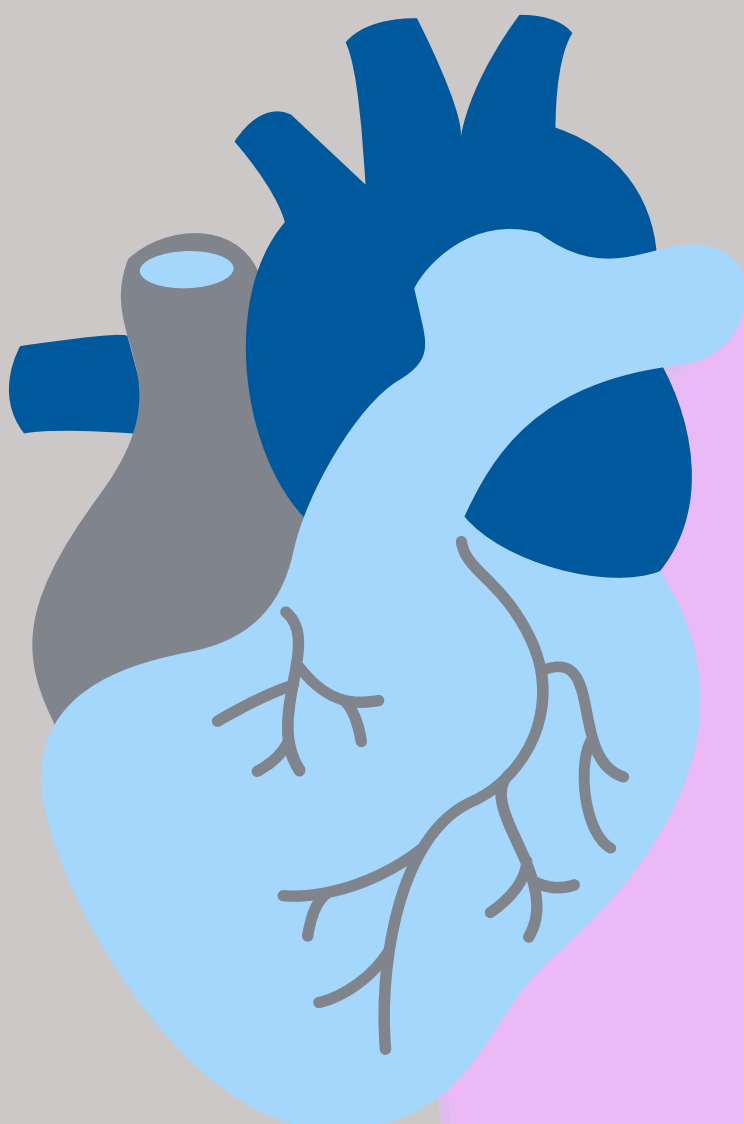

Rapid heartbeat

Anxiety attacks

High blood pressure

Insomnia

Seizures in severe cases

Healthy Alternatives:

Water

Fruit Smoothies

Herbal Tea

proper Sleep

Exercise

Psychedelics

Effects

Hallucinations
Altered sense of time
Emotional highs/lows
Increased heart rate
Dilated pupils
Nausea
Anxiety or panic

Dangers

Panic attacks
Paranoia
Confusion
Poor decision-making
Dangerous behavior
Flashbacks
Mental health complications in vulnerable people

Legality

Many psychedelic drugs remain illegal federally in the United States.
Some states or cities have:
Decriminalized certain substances
or
Allowed limited medical/research use.
Laws vary by location.

Common Psychedelics include:
LSD – Acid, Psilocybin – Magic Mushrooms, DMT – Dimitri
Mescaline – Peyote

Effects can last
4-12
Hours

Short Term Effects

Anxiety/ Panic
Agression
Irritability
Feeling of Euphoria

Increased Heart Rate
Higher Blood Pressure
Reduced appetite
Restlessness/ Shakiness
Increased Alertness

Long Term Effects

Addiction/ Dependence
Depression
Mood Swings
Memory Loss

Lung and nose damage
Heart Disease
Kidney Damage
Weight Loss
Hallucinations

Cocaine changes your brains reward system by flooding it with dopamine. Cravings slowly become intense and difficult to control, increasing usage due and building up tolerance. In recent years, cocaine-related deaths have increased due to lacing products with fentanyl.

Signs of overdose:

- Chest Pain
- Trouble Breathing
- Seizures
- Extrema Panic
- Losing Consciousness
- Blue lips or Fingertips

Call 911 immediately with suspected overdose, administer Narcan if available.

OPIOIDS

EFFECTS

Pain relief
Drowsiness
Slowed breathing and heart rate
Nausea
Confusion
Feelings of euphoria
Difficulty concentrating

IN USE

Opioids are pain reducers that work by affecting the brain's nervous system. Some are prescribed and some are obtained illegally. It is safe to use opioids if prescribed and used at a doctor's recommendation

Abuse of opioids is linked to:

Depression

Anxiety

Weakened immune system

Sleep problems

Hormone imbalance

Mood swings

Chronic constipation

Common Opioids:

Oxycodone, Hydrocodone,
Fentanyl, Morphine, Heroin

RISKS

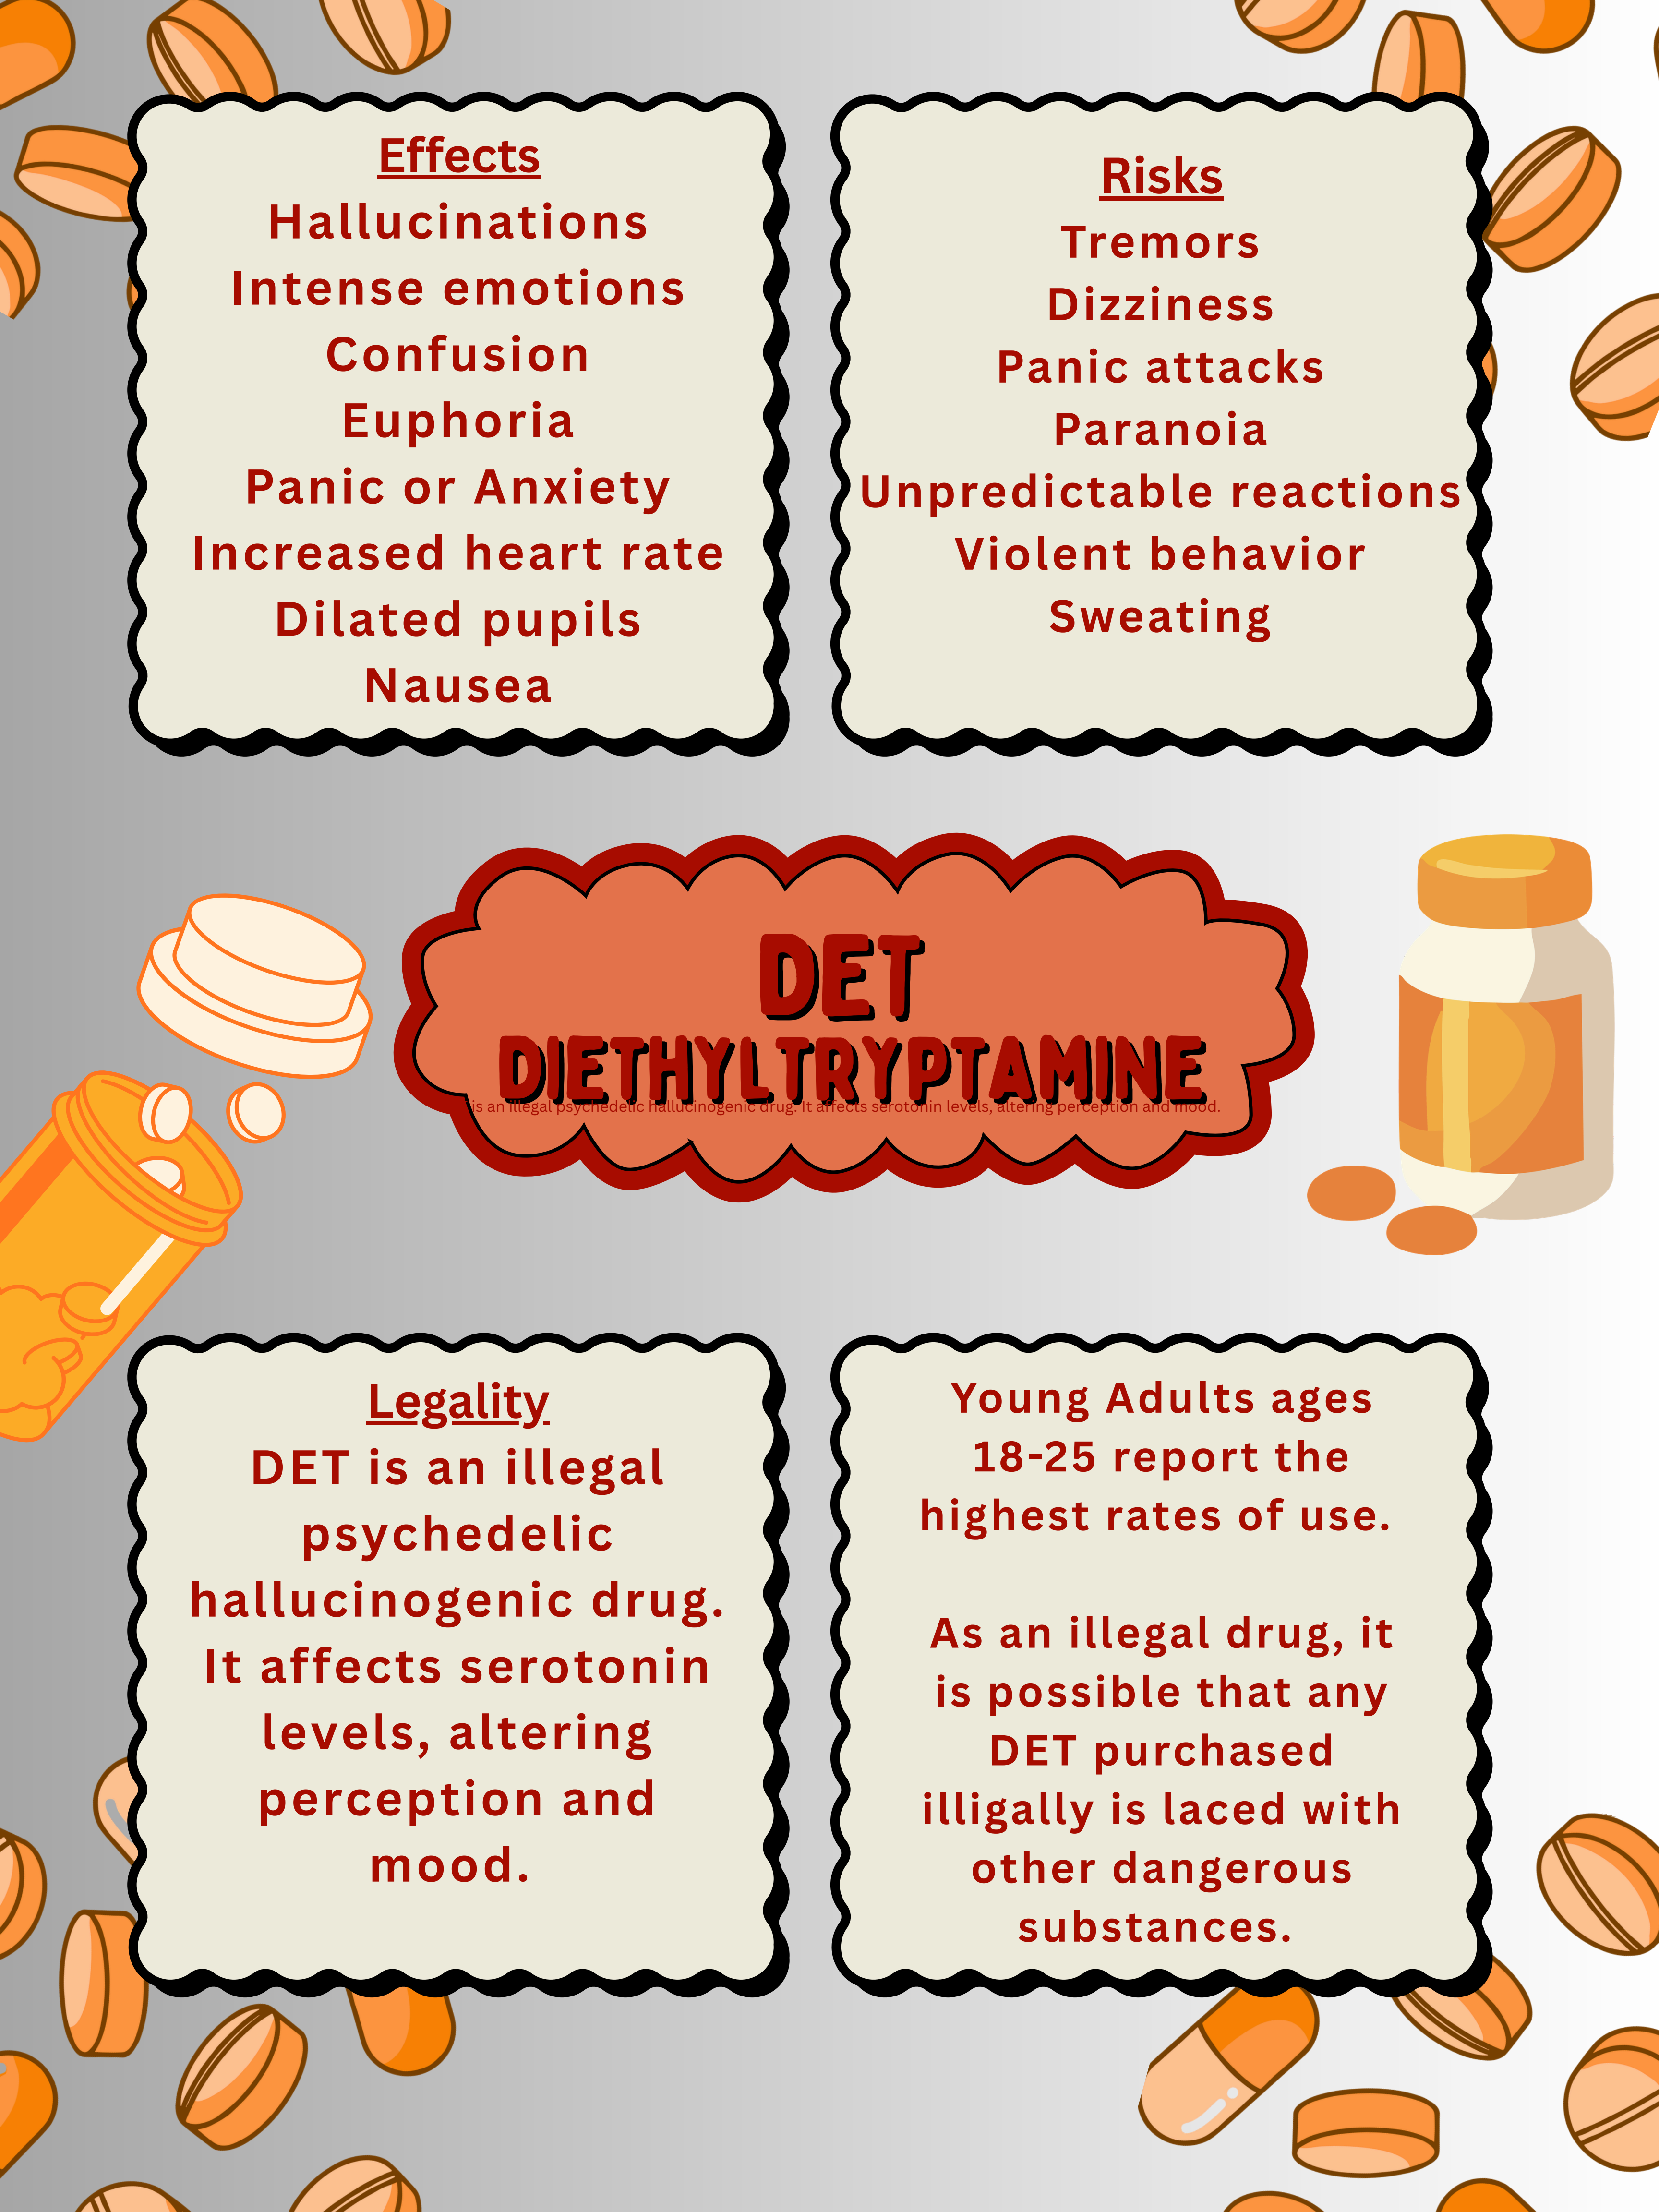

Addiction
Overdose
Coma
Brain damage
Death

OVERDOSE SIGNS

Very slow or stopped breathing
Blue lips or fingertips
Unconsciousness
Pinpoint Pupils
Gurgling or Choking Sounds

Call 911 immediately if overdose is suspected, administer Narcan if available.

Effects

Hallucinations
Intense emotions
Confusion
Euphoria
Panic or Anxiety
Increased heart rate
Dilated pupils
Nausea

Risks

Tremors
Dizziness
Panic attacks
Paranoia
Unpredictable reactions
Violent behavior
Sweating

DET DIETHYLTRYPTAMINE

DET is an illegal psychedelic hallucinogenic drug. It affects serotonin levels, altering perception and mood.

Legality

DET is an illegal
psychedelic
hallucinogenic drug.
It affects serotonin
levels, altering
perception and
mood.

Young Adults ages
18-25 report the
highest rates of use.

As an illegal drug, it
is possible that any
DET purchased
illegally is laced with
other dangerous
substances.

Ketamine

Ketamine is a powerful dissociative drug originally developed for medical anesthesia.

The K-Hole State

A state caused by high dosages of Ketamine, causing users to lose awareness of their surroundings, feel separated from their body, be unable to move or speak, experience terrifying hallucinations.

Effects and Risks

- Hallucinations
- Confusion
- Feeling detached from reality
- Memory problems
- Panic or fear
- Bladder and kidney damage
- Severe stomach pain
- Increased heart rate
- High blood pressure
- Nausea or vomiting
- Slurred speech
- Loss of coordination
- Numbness

Signs of misuse...

- Sudden mood swings
- Poor memory
- Secretive behavior
- Loss of balance
- Empty vials or powder residue
- Declining school or work performance

Also called...

- Special K
- K
- Kit Kat
- Vitamin K
- Cat Valium

Used as...

- Clear liquid in medical vials
- White powder
- Small white crystals or tablets

G-3

What is G-3?

A synthetic Psycadellic that an be used as tablets, powder, or capsules. It provides strong Psycaldeic effects for 8-12 hours.

Also Called: DOG-3 and Ganesha-3

Unknown strength and cross-contamination in synthetic and illegal psychedelics can make G-3 particularly dangerous. There is little research on long term effects, drug interactions, and safe dosage levels.

G-3 targets the serotonin receptors in the brain, similar to LSD. This may cause extreme mood changes, and hallucinations.

Effects:

Altered perception
Relaxation
Visual Imagery
Anxiety
Confusion
Nausea
Increased heartrate
Panic
Impaired judgemnt

K-2 and Synthetic Marijuana

Synthetic Marijuana = Unpredictable Risk

K-2 (AKA “Spice”) is a synthetic cannabinoid that uses dangerous chemicals that are sprayed onto dried plant material.

Other names:
Fake Weed
Black Mamba
Scooby Snax

Physical Effects

- Rapid heart rate
- High blood pressure
- Sweating
- Nausea/vomiting
- Seizures

Mental Effects

- Anxiety
- Panic attacks
- Hallucinations
- Paranoia
- Aggression
- Confusion

Warnings to know:

- Thousands of emergency room visits in the U.S. have been linked to synthetic cannabinoids.
- Poison control centers receive thousands of K2-related calls each year.
- Synthetic cannabinoids can be up to 100 times stronger than natural THC in some cases.

THE EFFECTS OF Alcohol

Alcohol contributes to over 178,000 deaths per year in the United States.

Underage drinking causes thousands of injuries and deaths annually.

Excessive drinking increases risks for accidents, violence, and health problems.

Physical Effects:

- Slurred speech
- Poor coordination
- Slowed reaction time
- Nausea/vomiting
- Drowsiness
- Blurred vision

Mental Effects

- Lowered inhibitions
- Poor decision-making
- Mood swings
- Memory problems
- Risk-taking behavior

Possible Long Term Effects

- Addiction/alcohol use disorder
- Liver disease
- Heart disease
- Depression/anxiety
- Brain damage
- Increased cancer risk

Alcohol Poisoning?

- Trouble staying awake
- Vomiting repeatedly
- Slow or irregular breathing
- Blue or pale skin
- Seizures
- Unconsciousness

Nicotine

Brain development

Nicotine can affect your brain development until the age of 25. This can alter your memory, attention, learning capabilities, and mood control or self-regulation.

Risks

- Lung damage
- Heart disease
- Breathing problems
- Mental health effects
- Addiction
- headaches

Quick FAQs

- WHO estimates 15 million teens or more are using E-cigs.
- 309 Million vape products were sold in the us in 2023

Note, these are just vapes, not All tobacco products!
